What is Computer Graphics?

- at the most basic level: conversion from 3D scene description to 2D image

- what do you need to describe a static scene?
  - 3D geometry and transformations
  - lights
  - material properties

- most common geometry primitives in graphics:
  - vertices (3D points) and normals (unit-length vector associated with vertex)
  - triangles (set of 3 vertices, high-resolution 3D models have M or B of triangles)

The Graphics Pipeline

- <u>geometry + transformations</u>

- <u>cameras and viewing</u>

- lighting and shading

- rasterization

- texturing

Scan of photo of tabletop setup

Some History
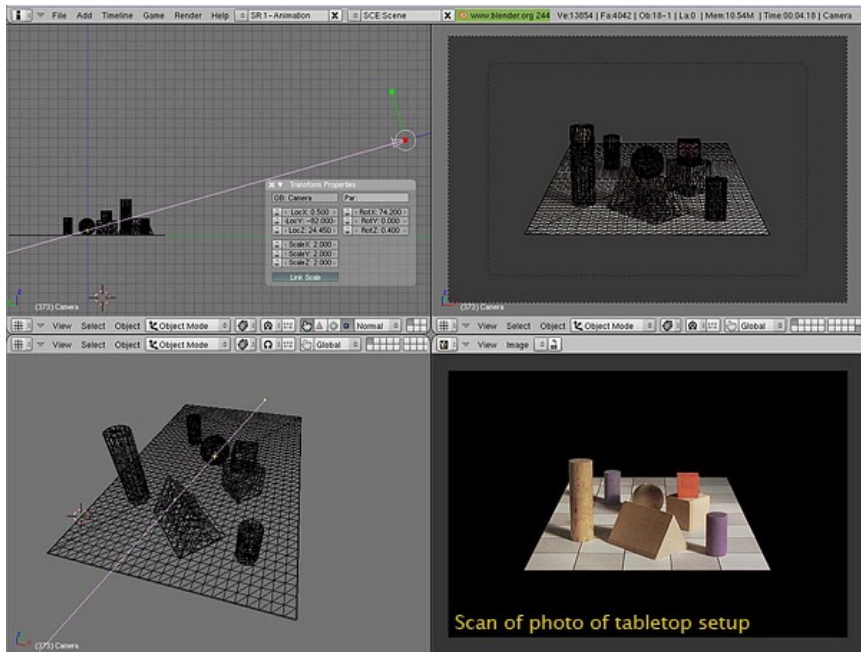

- Stanford startup in 1981

- computer graphics goes hardware

- based on Jim Clark's geometry engine

**The Geometry Engine:
A VLSI Geometry System for Graphics**

by

James H. Clark

Computer Systems Laboratory
Stanford University
and
Silicon Graphics, Inc.
Palo Alto, California

Abstract

The *Geometry Engine* [1] is a special-purpose VLSI processor for computer graphics. It is a four-component vector, floating-point processor for accomplishing three basic operations in computer graphics: matrix transformations, clipping and mapping to output device coordinates. This paper desribes the Geometry Engine and the Geometric Graphics System it composes. It presents the instruction set of the system, its design motivations and the Geometry System architecture.

- **High Performance Floating Point** - Its effective computation rate is equivalent to 5 million floating-point operations per second, corresponding to a **fully** transformed, clipped, scaled coordinate each 15 microseconds.

- **Reconfigurable** - Each Geometry Engine is "softly" configured; that is, one device with a single configuration register serves in twelve different capacities.

- **Selection/Hit-Testing Mechanism** - The Geometry Engine has a "hit-testing" mechanism to assist in "pointing"

![SiliconGraphics]
Figure 3: Geometry System; each block is a Geometry Engine.

The subsystems are:

- **Matrix Subsystem** - A stack of 4x4 floating-point matrices for completely general, 2D or 3D floating-point coordinate transformation of graphical data.

- **Clipping Subsystem** - A windowing, or clipping, capability for clipping 2D or 3D graphical data to a window into the user's virtual drawing space. In 3D, this window is a volume of the user's virtual, floating-point space, corresponding to a truncated viewing pyramid with "near" and "far" clipping.

- **Scaling Subsystem** - Scaling of 2D and 3D coordinates to the coordinate system of the particular output device of the user. In 3D, this scaling phase also includes either orthographic or perspective projection onto the viewer's virtual window. Stereo coordinates are computed and optionally supplied as the output of the system.
The Graphics Pipeline

- monolithic graphics workstations of the 80s have been replaced by modular GPUs (graphics processing units); major companies: NVIDIA, AMD, Intel

- early versions of these GPUs implemented *fixed-function* rendering pipeline in hardware

- GPUs have become programmable starting in the late 90s

- e.g. in 2001 Nvidia GeForce 3 = first programmable shaders

- now: GPUs = programmable (e.g. OpenGL, CUDA, OpenCL) processors

The Graphics Pipeline

GPU = massively
parallel processor
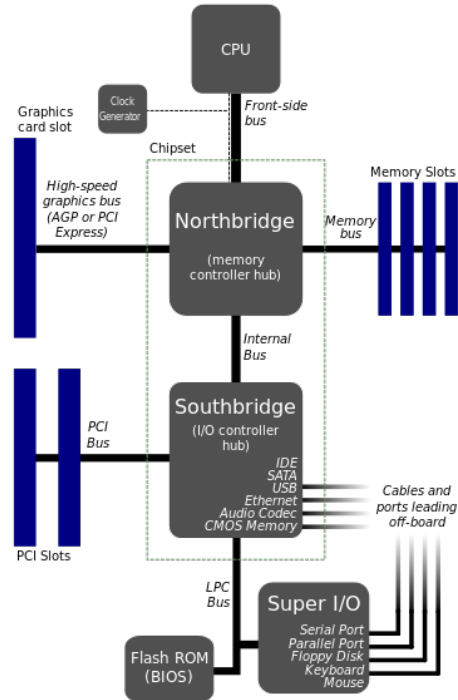

- OpenGL is our interface to the GPU!

- right: "old-school" OpenGL state machine

- today's lecture: vertex transforms

The OpenGL® Machine

I had this poster hanging on my dorm wall during undergrad

WebGL

- JavaScript application programmer interface (API) for 2D and 3D graphics

- OpenGL ES 2.0 running in the browser, implemented by all modern browsers

- overview, tutorials, documentation: see lab 1

three.js

- cross-browser JavaScript library/API

- higher-level library that provides a lot of useful helper functions, tools, and abstractions around WebGL – easy and convenient to use

- https://threejs.org/
- simple examples: https://threejs.org/examples/

- great introduction (in WebGL):

    http://davidscottlyons.com/threejs/presentations/frontporch14/

The Graphics Pipeline
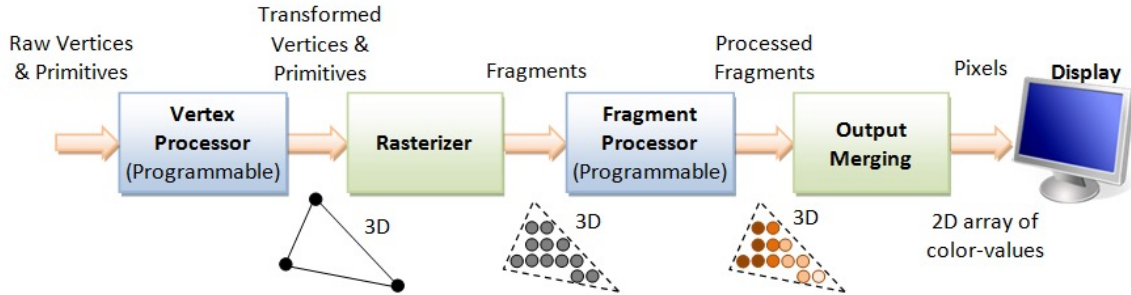

3D Graphics Rendering Pipeline: Output of one stage is fed as input of the next stage. A vertex has attributes such as (x, y, z) position, color (RGB or RGBA), vertex-normal (n_x, n_y, n_z), and texture. A primitive is made up of one or more vertices. The rasterizer raster-scans each primitive to produce a set of grid-aligned fragments, by interpolating the vertices.

The Graphics Pipeline

Raw Vertices & Primitives → Vertex Processor (Programmable) → Transformed Vertices & Primitives → Rasterizer → Fragments → Fragment Processor (Programmable) → Processed Fragments → Output Merging → Pixels → Display

2D array of color-values
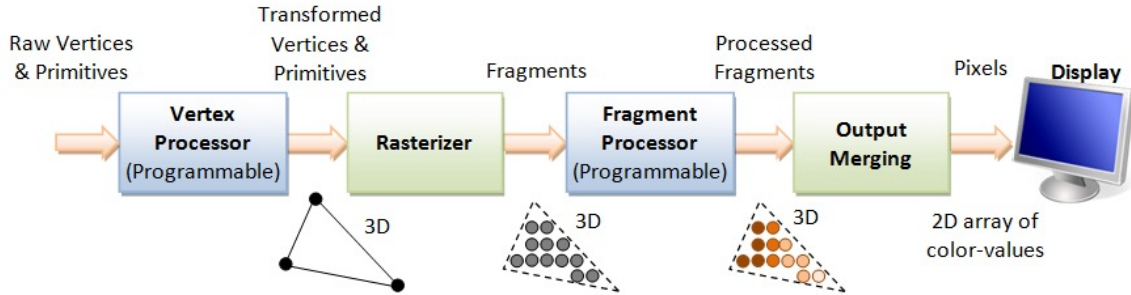

1. Vertex Processing: Process and transform individual vertices & normals.

The Graphics Pipeline
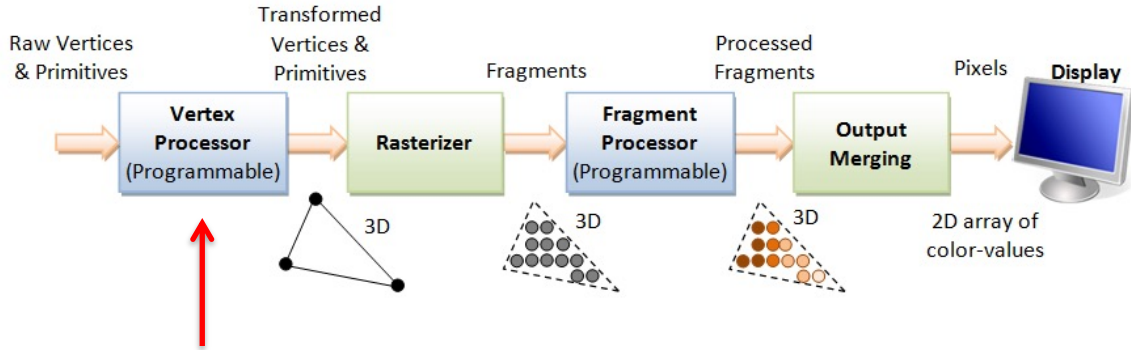

1. <u>Vertex Processing: Process and transform individual vertices & normals.</u>
2. Rasterization: Convert each primitive (connected vertices) into a set of fragments. A fragment can be interpreted as a pixel with attributes such as position, color, normal and texture.
3. Fragment Processing: Process individual fragments.
4. Output Merging: Combine the fragments of all primitives (in 3D space) into 2D color-pixel for the display.

The Graphics Pipeline

vertex shader

- transforms & (per-vertex) lighting

fragment shader
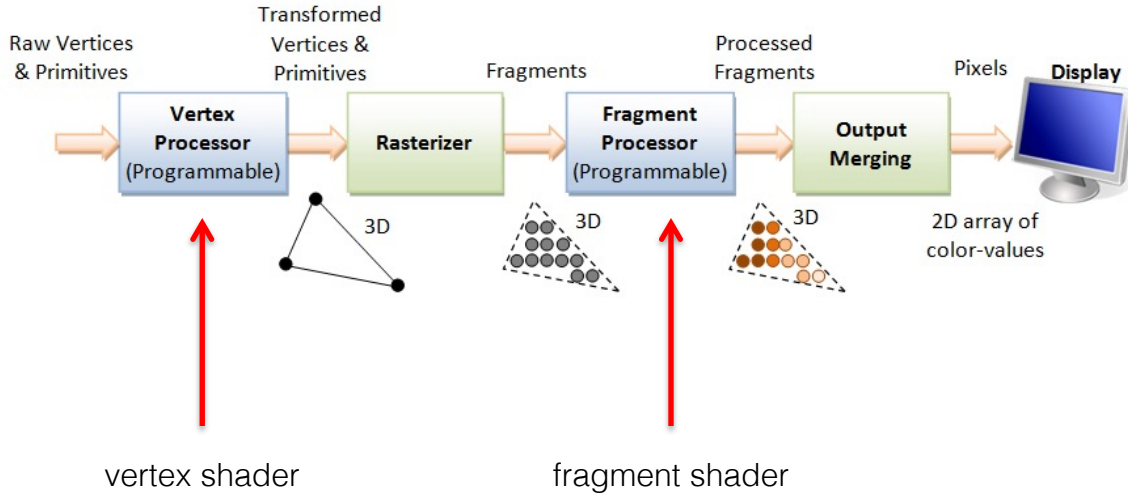

- texturing
- (per-fragment) lighting

Coordinate Systems

- right hand coordinate system

- a few different coordinate systems:
  - object coordinates
  - world coordinates
  - viewing coordinates
  - also clip, normalized device, and
    window coordinates

Right Handed Coordinates

wikipedia
Primitives

- vertex = 3D point v(x,y,z)

- triangle = 3 vertices

- normal = 3D vector per vertex describing
  surface orientation $n=(n_x,n_y,n_z)$
Pixels v Fragments

- fragments have rasterized 2D coordinates on screen but a lot of other attributes too (texture coordinates, depth value, alpha value, …)
- pixels appear on screen
- won't discuss in more detail today

Rasterizer → **Output Merging**

A *primitive* is formed by one or more *vertices*. Vertices are not grid-aligned

Grid-aligned *fragments* are interpolated from vertices.

All primitives are merged to produce 2D *pixels* on the display
Vertex, Primitives, Fragment and Pixel
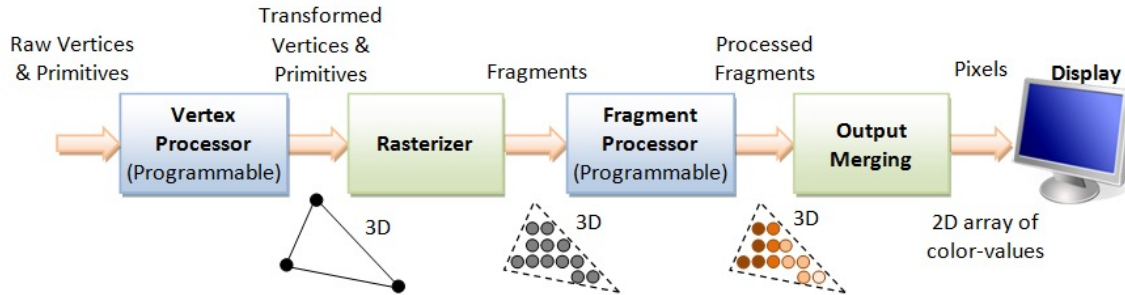

Vertex Transforms

Vertex Transforms

Raw Vertices & Primitives → **Vertex Processor (Programmable)** → Transformed Vertices & Primitives → **Rasterizer** → Fragments → **Fragment Processor (Programmable)** → Processed Fragments → **Output Merging** → Pixels → **Display** → 2D array of color-values

Model Transform

- transform each vertex $v = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$ from object coordinates to world coordinates

Model Spaces (x_i, y_i, z_i)

World Space (x, y, z)

Objects are typically created in their *local spaces*.
We need to bring them into the common *world space*, via a series of affine transforms (translation, rotation and scaling).

Model Transform - Scaling

- transform each vertex $v = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$ from object coordinates to world coordinates

1. scaling as 3x3 matrix

$$S(s_x, s_y, s_z) = \begin{pmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & s_z \end{pmatrix}$$

scaled vertex = matrix-vector product: $\quad Sv = \begin{pmatrix} s_x & 0 & 0 \\ 0 & s_y & 0 \\ 0 & 0 & s_z \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} s_x x \\ s_y y \\ s_z z \end{pmatrix}$

Model Transform - Rotation

- transform each vertex $v = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$ from object coordinates to world coordinates

2. rotation as 3x3 matrix

$$R_z(\theta) = \begin{pmatrix} \cos\theta & -\sin\theta & 0 \\ \sin\theta & \cos\theta & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad R_x(\theta) = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \cos\theta & -\sin\theta \\ 0 & \sin\theta & \cos\theta \end{pmatrix} \quad R_y(\theta) = \begin{pmatrix} \cos\theta & 0 & \sin\theta \\ 0 & 1 & 0 \\ -\sin\theta & 0 & \cos\theta \end{pmatrix}$$

rotated vertex = matrix-vector product, e.g.

$$R_z v = \begin{pmatrix} \cos\theta & -\sin\theta & 0 \\ \sin\theta & \cos\theta & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} x\cos\theta - y\sin\theta \\ x\sin\theta + y\cos\theta \\ z \end{pmatrix}$$

Model Transform - Translation

- transform each vertex $v = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$ from object coordinates to world coordinates

3. translation cannot be represented as 3x3 matrix!

$$\begin{pmatrix} x \\ y \\ z \end{pmatrix} + \begin{pmatrix} d_x \\ d_y \\ d_z \end{pmatrix} = \begin{pmatrix} x + d_x \\ y + d_y \\ z + d_z \end{pmatrix}$$

that's unfortunate ☹

Model Transform - Translation

- solution: use homogeneous coordinates, vertex is

$$v = \begin{pmatrix} x \\ y \\ z \\ 1 \end{pmatrix}$$

3. translation is 4x4 matrix

$$T(d) = \begin{pmatrix} 1 & 0 & 0 & d_x \\ 0 & 1 & 0 & d_y \\ 0 & 0 & 1 & d_z \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$$Tv = \begin{pmatrix} 1 & 0 & 0 & d_x \\ 0 & 1 & 0 & d_y \\ 0 & 0 & 1 & d_z \\ 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \\ 1 \end{pmatrix} = \begin{pmatrix} x + d_x \\ y + d_y \\ z + d_z \\ 1 \end{pmatrix}$$

better ☺

Summary of Homogeneous Matrix Transforms

- translation $T(d) = \begin{pmatrix} 1 & 0 & 0 & d_x \\ 0 & 1 & 0 & d_y \\ 0 & 0 & 1 & d_z \\ 0 & 0 & 0 & 1 \end{pmatrix}$

- scale $S(s) = \begin{pmatrix} s_x & 0 & 0 & 0 \\ 0 & s_y & 0 & 0 \\ 0 & 0 & s_z & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$

- rotation $R_z(\theta) = \begin{pmatrix} \cos\theta & -\sin\theta & 0 & 0 \\ \sin\theta & \cos\theta & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$ $R_x = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos\theta & -\sin\theta & 0 \\ 0 & \sin\theta & \cos\theta & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$ $R_y = \begin{pmatrix} \cos\theta & 0 & \sin\theta & 0 \\ 0 & 1 & 0 & 0 \\ -\sin\theta & 0 & \cos\theta & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$

Read more: https://www.ntu.edu.sg/home/ehchua/programming/opengl/CG_BasicsTheory.html

Summary of Homogeneous Matrix Transforms

- translation $T(d) = \begin{pmatrix} 1 & 0 & 0 & d_x \\ 0 & 1 & 0 & d_y \\ 0 & 0 & 1 & d_z \\ 0 & 0 & 0 & 1 \end{pmatrix}$ inverse translation $T^{-1}(d) = T(-d) = \begin{pmatrix} 1 & 0 & 0 & -d_x \\ 0 & 1 & 0 & -d_y \\ 0 & 0 & 1 & -d_z \\ 0 & 0 & 0 & 1 \end{pmatrix}$

- scale $S(s) = \begin{pmatrix} s_x & 0 & 0 & 0 \\ 0 & s_y & 0 & 0 \\ 0 & 0 & s_z & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$ inverse scale $S^{-1}(s) = S\left(\dfrac{1}{s}\right) = \begin{pmatrix} 1/s_x & 0 & 0 & 0 \\ 0 & 1/s_y & 0 & 0 \\ 0 & 0 & 1/s_z & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$

Read more: https://www.ntu.edu.sg/home/ehchua/programming/opengl/CG_BasicsTheory.html

Summary of Homogeneous Matrix Transforms

- successive transforms: $v' = T \cdot S \cdot R_z \cdot R_x \cdot T \cdot v$

- inverse successive transforms:
$$
\begin{aligned}
v &= \left(T \cdot S \cdot R_z \cdot R_x \cdot T \right)^{-1} \cdot v' \\
&= T^{-1} \cdot R_x^{-1} \cdot R_z^{-1} \cdot S^{-1} \cdot T^{-1} \cdot v'
\end{aligned}
$$

<u>Vector</u> and Normal Transforms

- homogeneous representation of a vector *t*, i.e. pointing from v_1 to v_2:

$$t = \begin{pmatrix} (v_2 - v_1)_x \\ (v_2 - v_1)_y \\ (v_2 - v_1)_z \\ (1 - 1) \end{pmatrix} = \begin{pmatrix} t_x \\ t_y \\ t_z \\ 0 \end{pmatrix}$$
- successive transforms: $t' = M \cdot t = M \cdot (v_2 - v_1) = M \cdot v_2 - M \cdot v_1$

- this works!
Vector and <u>Normal</u> Transforms

- homogeneous representation of a normal
  (unit length, perpendicular to surface)

$$n = \begin{pmatrix} n_x \\ n_y \\ n_z \\ 0 \end{pmatrix}$$

- successive transforms ??? $\quad n' = M \cdot n$

- this does <u>NOT</u> work! (non-uniform scaling
  is a problem)

Vector and <u>Normal</u> Transforms

$$n = \begin{pmatrix} n_x \\ n_y \\ n_z \\ 0 \end{pmatrix}$$

- homogeneous representation of a normal
  (unit length, perpendicular to surface)

- need to use normal matrix = transpose of
  inverse for transformation!

$$n' = \left(M^{-1} \right)^T \cdot n$$

Vector and <u>Normal</u> Transforms

- homogeneous representation of a normal (unit length, perpendicular to surface)

$$n = \begin{pmatrix} n_x \\ n_y \\ n_z \\ 0 \end{pmatrix}$$

- need to use normal matrix = transpose of inverse for transformation!
$$n' = \left(M^{-1} \right)^T \cdot n$$

- fine print: only use upper left 3x3 part of modelview matrix for inverse transpose (no homogeneous normal representation) OR drop *w* component from *n'* after multiplying 4x4 inverse transpose (i.e. don't use *w* for normalization of *n*!)

Attention!

- rotations and translations (or transforms in general) are not commutative!
- make sure you get the correct order!
Rotate then Translate   **Translate then Rotate**

View Transform

View Transform – Attention!

- many graphics APIs have a function called lookat that automatically computes the view matrix for you

- Three.js also has such a function, but that only computes the rotation, not the translation, of the view matrix. So best implement the view matrix yourself!
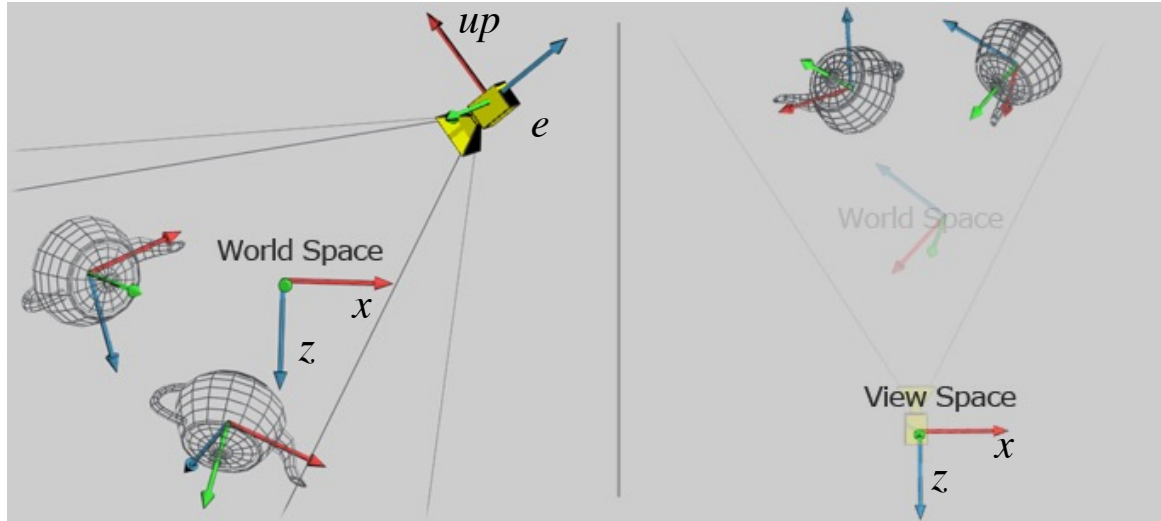

View Transform

- in camera/view space, the camera is at the origin, looking into negative z
- *modelview matrix* is combined model (rotations, translations, scaling) and view matrix!

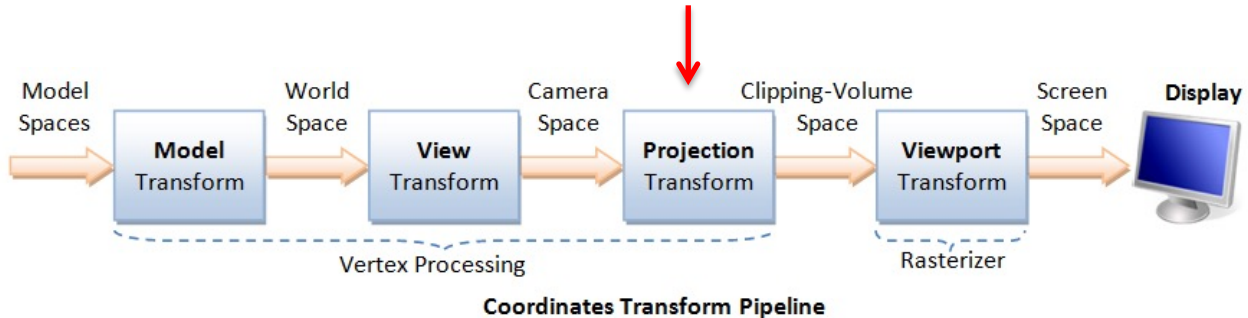

Coordinates Transform Pipeline

Projection Transform - Perspective Projection

- have <u>symmetric</u> view frustum

- fovy: vertical angle in degrees

- aspect: ratio of width/height

- zNear: near clipping plane (relative from cam)

- zFar: far clipping plane (relative from cam)

aspect = width/height

Perspective Projection: The camera's view frustum is specified via 4 view parameters: fovy, aspect, zNear and zFar.

$$f = \cot(fovy/2)$$

$$M_{proj} = \begin{pmatrix} \dfrac{f}{aspect} & 0 & 0 & 0 \\ 0 & f & 0 & 0 \\ 0 & 0 & -\dfrac{zFar + zNear}{zFar - zNear} & -\dfrac{2 \cdot zFar \cdot zNear}{zFar - zNear} \\ 0 & 0 & -1 & 0 \end{pmatrix}$$
<u>projection matrix</u>

(symmetric frustum)

Projection Transform - Perspective Projection

more general: a perspective "frustum" (truncated, possibly
sheared pyramid)

- left (l), right (r), bottom (b), top (t): corner coordinates
 on near clipping plane (at zNear)

perspective frustum

$$M_{proj} = \begin{pmatrix} \dfrac{2 \cdot zNear}{r-l} & 0 & \dfrac{r+l}{r-l} & 0 \\[2ex] 0 & \dfrac{2 \cdot zNear}{t-b} & \dfrac{t+b}{t-b} & 0 \\[2ex] 0 & 0 & -\dfrac{zFar+zNear}{zFar-zNear} & -\dfrac{2 \cdot zFar \cdot zNear}{zFar-zNear} \\[2ex] 0 & 0 & -1 & 0 \end{pmatrix}$$

⟵ projection matrix

(asymmetric frustum)

Projection Transform - Orthographic Projection

more general: a "box frustum" (no perspective, objects

don't get smaller when farther away)

- left (l), right (r), bottom (b), top (t): corner coordinates
  on near clipping plane
$$M_{proj} = \begin{pmatrix} \dfrac{2}{r-l} & 0 & 0 & -\dfrac{r+l}{r-l} \\ 0 & \dfrac{2}{t-b} & 0 & -\dfrac{t+b}{t-b} \\ 0 & 0 & \dfrac{-2}{f-n} & -\dfrac{f+n}{f-n} \\ 0 & 0 & 0 & 1 \end{pmatrix}$$
⟵ <u>projection matrix</u>

(orthographic)

Orthographic

Perspective

[Song Ho Ahn]

Projection Transform

- possible source of confusion for zNear and zFar:

  - Marschner & Shirley define it as absolute z coordinates, thus zNear>zFar and both values are always negative

  - OpenGL and we define it as positive values, i.e. the distances of the near and far clipping plane from the camera (zFar > zNear)

Modelview Projection Matrix

- put it all together with 4x4 matrix multiplications!

$$v_{clip} = M_{proj} \cdot M_{view} \cdot M_{model} \cdot v = M_{proj} \cdot M_{mv} \cdot v$$

from today!

The Graphics Pipeline

- assign fixed color (e.g. red) to each vertex in window coordinates (fragment)
- interpolate (i.e. rasterize) lines between vertices (as defined by user)

… and we can almost do this …

Summary

- graphics pipeline is a series of operations that takes 3D vertices/normals/triangles as input and generates fragments and pixels

- today, we only discussed a part of it: vertex and normal transforms

- transforms include: rotation, scale, translation, perspective projection, perspective division, and viewport transform

- most transforms are represented as 4x4 matrices in homogeneous coordinates
  → know your matrices & be able to create, manipulate, invert them!

Next Lecture: Lighting and Shading, Fragment Processing
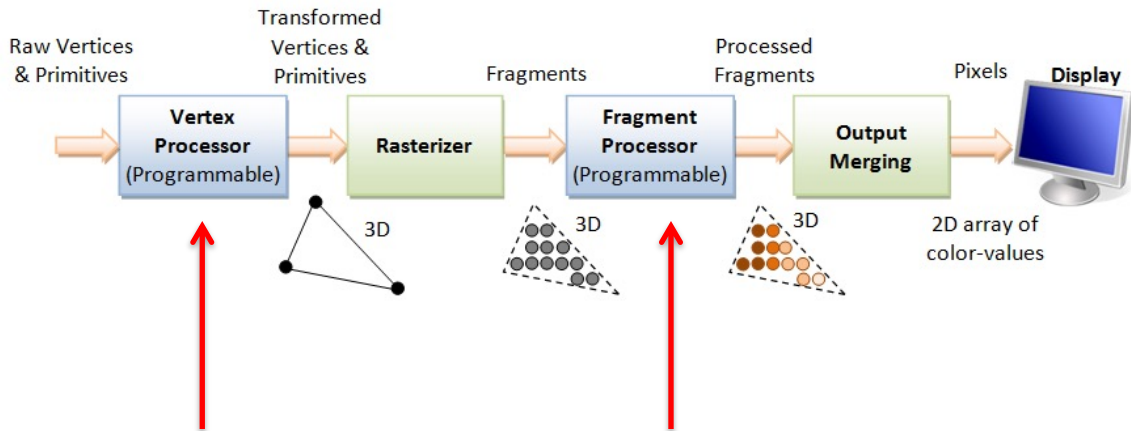

vertex shader

- transforms & (per-vertex) lighting

fragment shader

- texturing
- (per-fragment) lighting

Further Reading

- course notes on transforms (see course website)

- good overview of OpenGL (deprecated version) and graphics pipeline (missing a few things) :

  https://www.ntu.edu.sg/home/ehchua/programming/opengl/CG_BasicsTheory.html

- textbook: Shirley and Marschner "Fundamentals of Computer Graphics", AK Peters, 2009

- definite reference: "OpenGL Programming Guide" aka "OpenGL Red Book"

- WebGL / three.js tutorials: https://threejs.org/
